

Based on Sobel Algorithm given here

(Link also useful for horizontal and vertical gradients):

<http://edge.kitiyo.com/2009/codes/sobel-core-verilog-module.html>

Inputs:

- Gx (horizontal gradient) // signed binary value (11 bits)
// wire signed [10:0] Gx;
- Gy (vertical gradient) // signed binary value (11 bits)
// wire signed [10:0] Gy;

Outputs:

- G // 8 bit pixel value
// wire [7:0] G;

Algorithm:

1. Find absolute values of signed Gx & Gy
 - a. $\text{abs_gx} = (\text{gx}[10] ? \sim \text{gx} + 1 : \text{gx});$
 - b. $\text{abs_gy} = (\text{gy}[10] ? \sim \text{gy} + 1 : \text{gy});$
2. Find sum of Abs_Gx & Abs_Gy
 - a. $\text{sum} = \text{abs_gx} + \text{abs_gy}$
3. Find G
 - a. $G = (\text{sum}[10] | \text{sum}[9] | \text{sum}[8]) ? 8'b11111111 : \text{sum}[7:0]$
